Conclusions

- Se obtuvieron materiales basados en IrO₂ y WO₃.
- El material IrO₂-WO₃ (50:50) presenta una menor energía de sobrepotencial de activación a temperatura ambiente, y una densidad de corriente máxima cercana a 20 mA/cm² a 1.8 V vs Hg/Hg₂SO₄.
- Se obtuvo una resistencia a altas frecuencias de 5.4 Ω y una resistencia a la transferencia de carga de 20.9 Ωcm².
- Se redujo el costo al utilizar el 50% del material.
- El material IrO₂-WO₃ (50:50) es un material propicio para REO en un electrolizador.
